Link to this page. As we approach Earth Day, it's important to celebrate the huge impact that insects have on our environment. The work of these remarkable creatures has the potential to make our world a healthier, safer, cleaner place to live in. In the old days, a bug was just an annoying bug. It was often to be avoided. They were generally not seen as heroic heroes, and in general, they were, well, bugs. Today, thanks in part to the work of insect ecologists and entomologists, we are learning more about the benefits of insects than ever before. When we look back at history, we can see that the humble insect was a huge inspiration for artists in all cultures. As our relationship with insects has grown, we have had to face the question: If we are the highest life

form on the planet, what does it mean to be a bug? And, if we are lucky enough to be able to live in harmony with this natural, most amazing, most amazing force, we should take pride in the huge contribution insects make to our environment and to our well-being. Do you want to support New Jersey's environment? It is often said that all the Earth's creatures are interdependent. Many people realize that humans are dependent upon the other creatures that share this planet with us. But we don't often realize how important the insects are to us. Like us, insects need a safe place to live. They need places to grow, breed and live. And they need a way to move from one place to the next. Unlike us, most insects are very small and light, and they are able to move easily through space, much like a leaf on the wind. They travel by flying, hopping, or gliding. We have to thank the insects for much of our physical health. Without them, we would not have modern medicine and pharmaceuticals. Insects are the main ingredient in many drugs used for diseases such as antibiotics, steroids, and painkillers. Insects are the basis for the insecticide industry, as well as for insect food. Fruit flies, mealworms, and bees are just a few examples of the many insects we use for food. Along with our health, insects help to keep our home planet clean. All of the insects that live on Earth are important in keeping our earth clean. Insects are very efficient 82157476af
